Consulting in all areas of Information Technology

IT Enabled Business

We have all seen first hand how a technology enabled business can empower the breadth and depth of a small business' operations. Design, deployment and management of the right technology can help businesses to focus and improve on their core abilities, while making non-core activities more efficient and easier to manage. With the focus of value in today's knowledge based economies being placed on adding value to the customer, small businesses with their naturally close proximity to their customer base are the obvious vehicles to deliver this value.

IT Strategy

Downward pressure on costs, an increasingly competitive market and plans for business expansion can all make demands on an organisation's IT infrastructure. We work closely with clients to deliver both company-wide and divisional IT strategies, incorporating a work programme to facilitate implementation of the strategies and attainment of business benefit. To achieve this, we collaborate with clients to review the strategic business needs across their organisation, assess the key capabilities for each business area and identify the drivers for competitive advantage.

IT Consultancy

With our extensive business I.T. experience, we are well placed to help you design, implement and maintain the optimum I.T. solution for your business. You can ask us for up-to-the-minute advice and project management for any aspect of I.T. – from selecting hardware and software, to network planning and installation, to management and maintenance – and everything in between.

Our initial consultation is free of charge.

Strategic Alignment of Business and IT Goals

The focus of this service is to address the following key questions:

- Are your IT plans aligned with your business plans?
- Are your current information technology systems capable of reliably supporting you in the medium to long term and have you good quality IT procedures?
- How well are you managing your current IT systems and are your staff happy?
- Do you have valuable resources and time being wasted trying to get your systems to work for you, do you employ secondary systems/processes to get around system issues or deficiencies?

The Benefits:

- Improve your ability to plan resources and budget for future IT investment.
- Highlights potential weaknesses in you current IT management and infrastructure.
- Provides clear cost justification for IT improvement projects.
- Helps to identify opportunities for improving the use and management of IT within your organisation.

Project Deployment

With Prince2 certified practitioners at NTS - whether you are setting up new, upgrading or relocating your office/implementing a specific IT project we have skills to deliver.

- Business system - application development
- Relocation Management
- Network Design and Implementation
- Desktop Standardisation and Upgrades
- Web design and build

Our experienced consultants focus initially on the client's objectives and requirements, and present accurate, practical and costed solution options.

Business Intelligence

Many organisations find that they have mountains of data but little in the way of useful business information. Business Intelligence (BI) is a discipline that improves business decision making by employing fact based and data driven support systems. NTS offers a range of BI services that empowers business users and decision makers to solve everyday business challenges.

IT Management

NTS offer all of the functions of a qualified and capable IT Manager. These include:

- Disaster recovery / business continuity planning
- Problem solving
- System Support
- System Development
- Problem Prevention
- IT Strategy Planning

Web Site Development

An Internet presence is an essential component of any modern business. It has an important and pivotal influence on how your business is perceived by others. NTS understands that your website should provide functionality for both the casual visitor and your customers. An intelligently planned site should also constitute a useful resource for your staff. NTS has a wealth of experience and knowledge of developing websites which meet these key criteria.

We will take your design ideas and incorporate them into your site and at the same time develop some of our own ideas and produce several design concepts. These will be enhanced until an overall "look" has been chosen by you, before functional site development takes place.

Bespoke Development

Using up to date technologies we can create bespoke solutions for your business. We offer customer programming to provide tailor-made solutions to your individual circumstances. We will carry out requirements gathering, system design & development, testing & delivery

The benefits of bespoke development are significant. They allow you, the client, to target all of your business requirements in a way that "off the shelf" solutions can never match.
